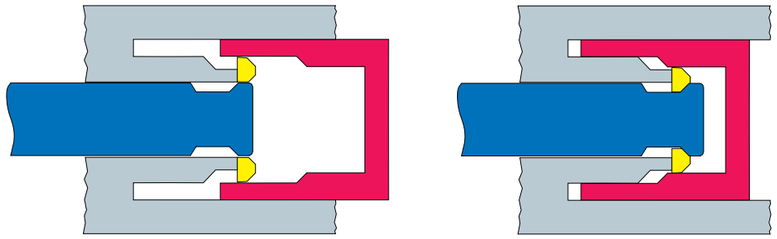
Clamping and locking - but how?

Modern production systems require modular construction so that they can adapt quickly to the growing flexible demands of modern manufacturing.

Workpiece rest and changeover times need to be minimised. Motor spindles demand rapid tool changing and whole machine assemblies have to be separated and connected automatically.

The choice of a system for each specific purpose is only possible if all the operating requirements have been carefully analysed and the needs clearly defined.

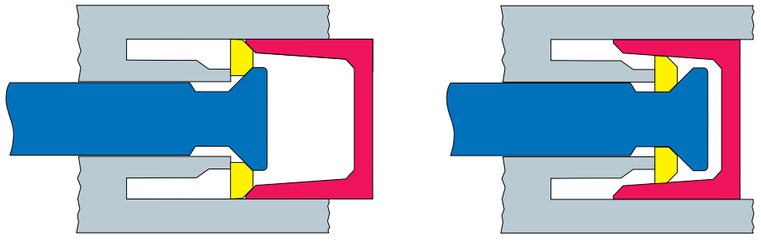
Dock Lock



The CyTec locking coupling, mechanically connects and positively locks two parts, with low backlash as required but, however, without preload.

CyDock

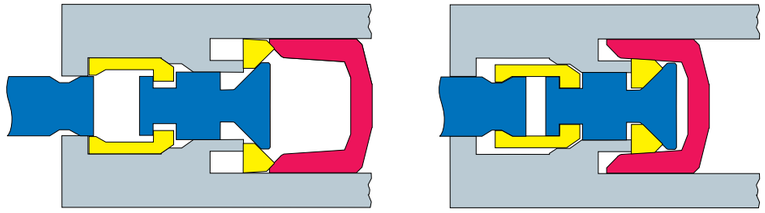
Pre-load Lock



The CyTec units pre-load and positively lock without the coupling function

CyDim **CyTab**

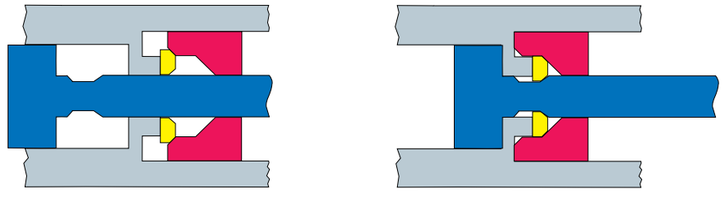
Couple Clamp Lock



The CyTec units automatically clamp and lock with pre-load.

CyTrac **CyTab**

Locking Cylinder



The CyTec locking cylinder mechanically positively locks the piston rod to the desired end position (also with pre-load).

CyLock

Force

The strength of a system is dependent on the strength and type of material used and the component contours. The tension force, however, is dependent upon the pressure available of the operating medium and the piston size. Depending upon the application a pneumatic pressure of between 5 and 10 bar or a hydraulic pressure of between 20 and 80 bar is recommended. Other pressures are available on request.

Environmental conditions

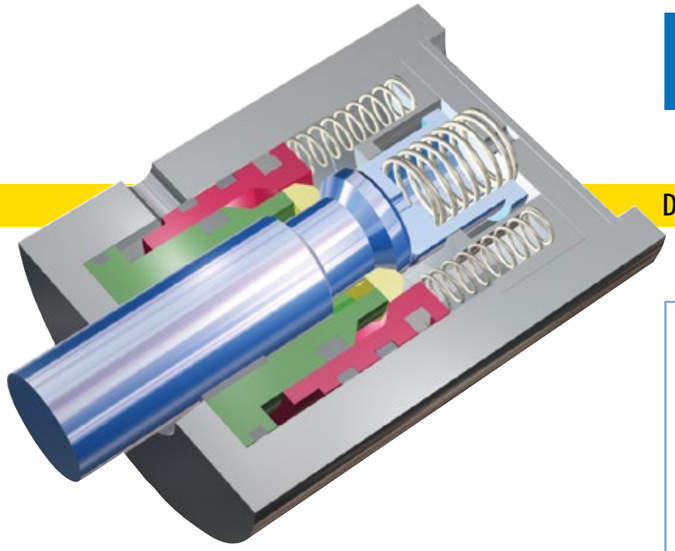
Due to the special geometry of the three dimensional system, a secure positive lock is guaranteed even under the influence of knocks and vibration. Even with temperatures of up to 60°C and the typical humidity values found in production halls no special measures need to be taken. When using heat resistant Viton seals it is possible to operate at an ambient temperature of 180°C.

Special constructions

Housing alterations for each product line to meet customer requirements are possible. Electrical lock sensors, interior coolant feeding, rotary unions and electronic monitoring systems are available.

CyDock

Docking system with safety lock



The **CyDock** docking system guarantees the ultimate in precision and safety using simple technology. A coupling bolt is automatically positively locked by means of radially operating locking segments. On request this is done free from play. The coupling is released by applying hydraulic or pneumatic force. Holding forces of up to several hundred tons can be achieved. As an optional extra safety check electrical sensors can be fitted to check locking. **CyDock** is suitable whenever secure connections have to be made and released as easily as possible.

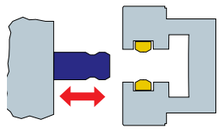
The docking systems operation is easy to explain:

Couple mechanically,
release hydraulically or pneumatically

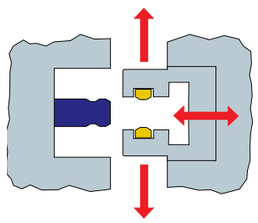
Geometry

When coupling two parts the following design arrangements are available to suit the application:

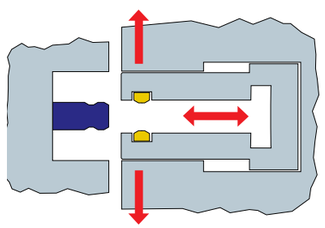
The bolt head protrudes, the feed motion is external and axial.



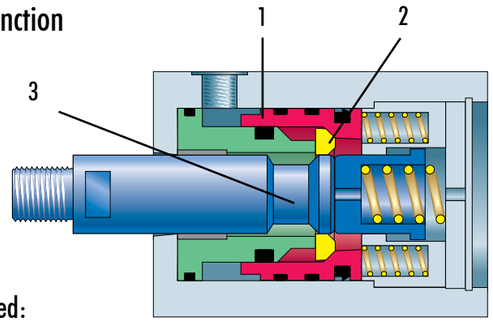
Undesirable for the bolt head to protrude. Self centering desired, active part protrudes.



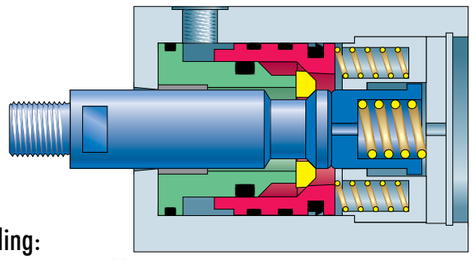
No parts may protrude, parallel movement in the unlocked position is possible.



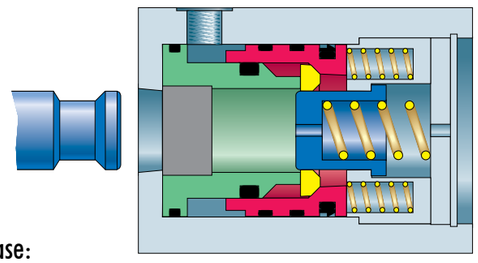
Function



Feed:
The pre-centered bolt is pushed into the coupling housing



Coupling:
A spring operated slide (1) presses radially moving three dimensional locking segments (2) into the annular groove (3) of the coupling bolt, and creates a positive lock.



Release:
Pressure is introduced into the ring surface of the slide. This is then forced against the springs allowing the segments to disengage from the annular groove.

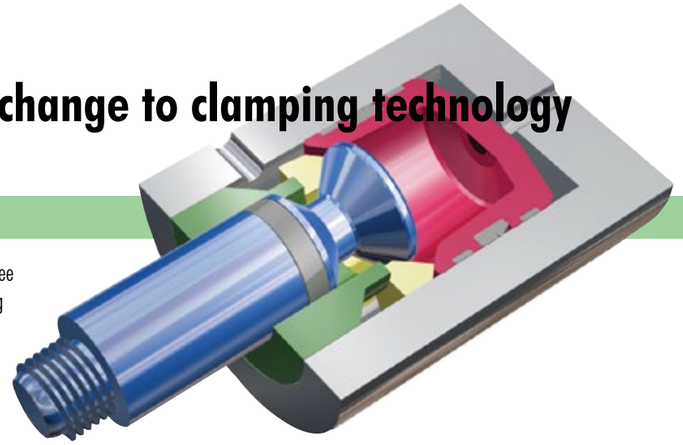
CyDim

A principle change to clamping technology



Three dimensional clamping system

The success of a design lies in its simplicity. A fine example of this is the three dimensional clamping system **CyDim**. As a universally applicable connecting element it is capable of meeting nearly all the demands of flexible production systems.

Many applications require more than two parts to be simply coupled. To prevent movement between the individual elements a connection with pre-load is required. The **CyDim** can be operated hydraulically or pneumatically. Using simple methods it fulfils the 3 most important functions of clamping technology:

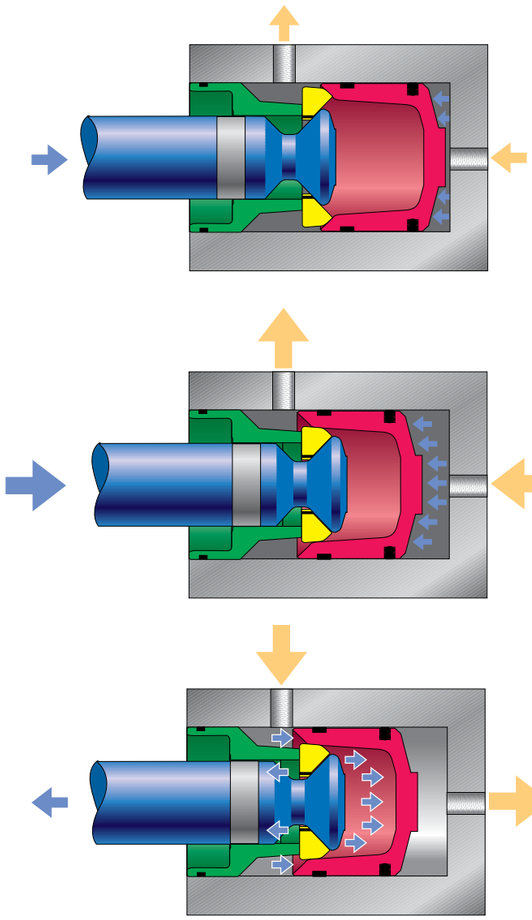
- Very high forces whilst using minimum space
- Self retention of the clamping force without maintaining pressure
- Low clamping and release pressure

With only a few component parts the formula: Force=pressure x surface area is qualified. Here the clamping force is increased by means of the three dimensional wedge system and is, additionally, self locked in the clamped position. Three times the force transmitted can be achieved along a linear characteristic curve. Therefore, with a piston diameter of 40 mm and 60 bar oil pressure more than 20 kN can be produced.

Compared to the known toggle clamp system, the **CyDim** offers an increase in force in a neutral position at the same time allowing mechanical self locking. This opens up completely new possibilities in clamping technology.

The positive lock of the three dimensional clamping system also guarantees the highest degree of safety enabling the clamping force to be maintained without maintaining pressure. Clamping tasks of every kind can be fulfilled with a system that is elegant and cheap and uses the minimum of building space.

Function



Feed process:
The force produced by the piston is transferred into a pulling motion without any increase in force. The distance ratio is 1:1.

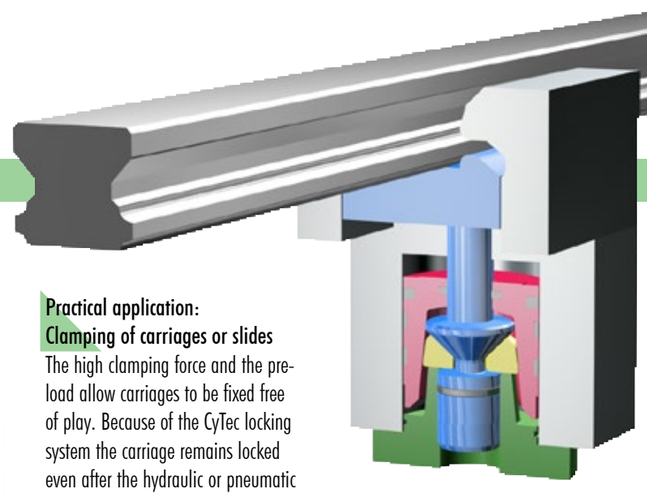
Clamping process:
After a transitional phase the force increases 3 fold due to the altered angle of the locking slide and remains constant until the end of stroke. During the total clamping process self locking prevails. Pressure does not have to be maintained.

Release process:
By applying pressure to the second port the lock is released ejecting the bolt at the same time. The useable release force is calculated from force x projected surface area of the sealed diameter.

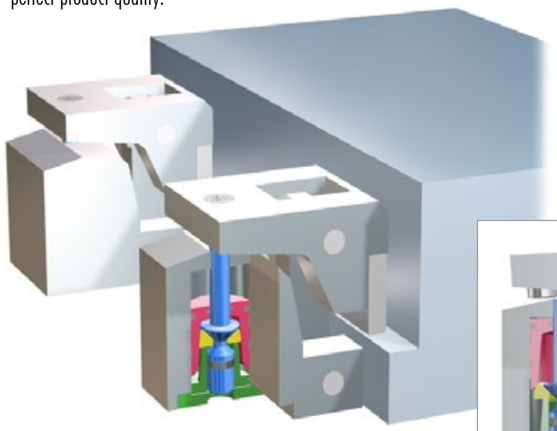
CyDim

The **CyDim** clamping system has found many uses where precise joining of component parts within an automatic production process is required.

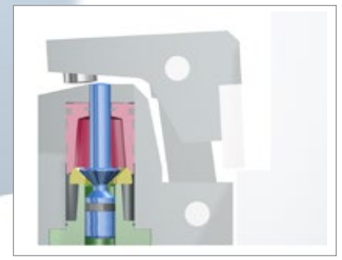
Its use in the machine tool industry should be emphasised. Through its ability to clamp tools or workpieces precisely and free of play the **CyDim** guarantees perfect product quality.

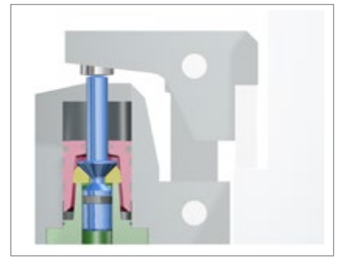


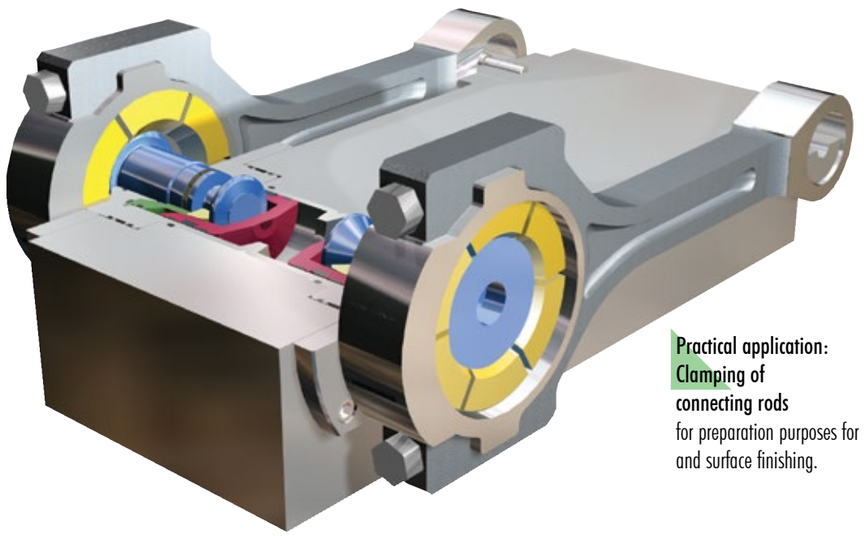
Practical application:
Clamping of carriages or slides
The high clamping force and the pre-load allow carriages to be fixed free of play. Because of the CyTec locking system the carriage remains locked even after the hydraulic or pneumatic supply is shut off.



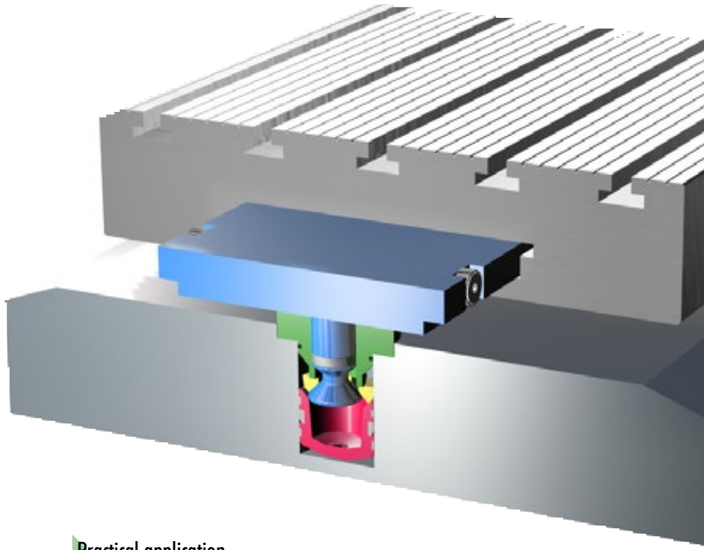
Practical application:
Block clamping system
With narrow conditions in injection mould machines the use of the block clamping system is recommended which enables the clamping with a stroke movement. The system guarantees highest forces with optimal system rigidity.







Practical application:
Clamping of connecting rods
for preparation purposes for grinding and surface finishing.



Practical application:
Pallet clamping system
For transit or insert pallets in accordance with DIN 55201 or similar, we offer the **CyTab** pallet clamping system. This modification of the three dimensional clamping system is a simple cost effective system that offers high clamp forces and self locking. These units are used with suitable T bolt or double T bolt clamps. The integrated pre-load guarantees fixing of the pallet free of play. On request a lifting function and a transport lock can be integrated.

CyTrac Collet clamp lock

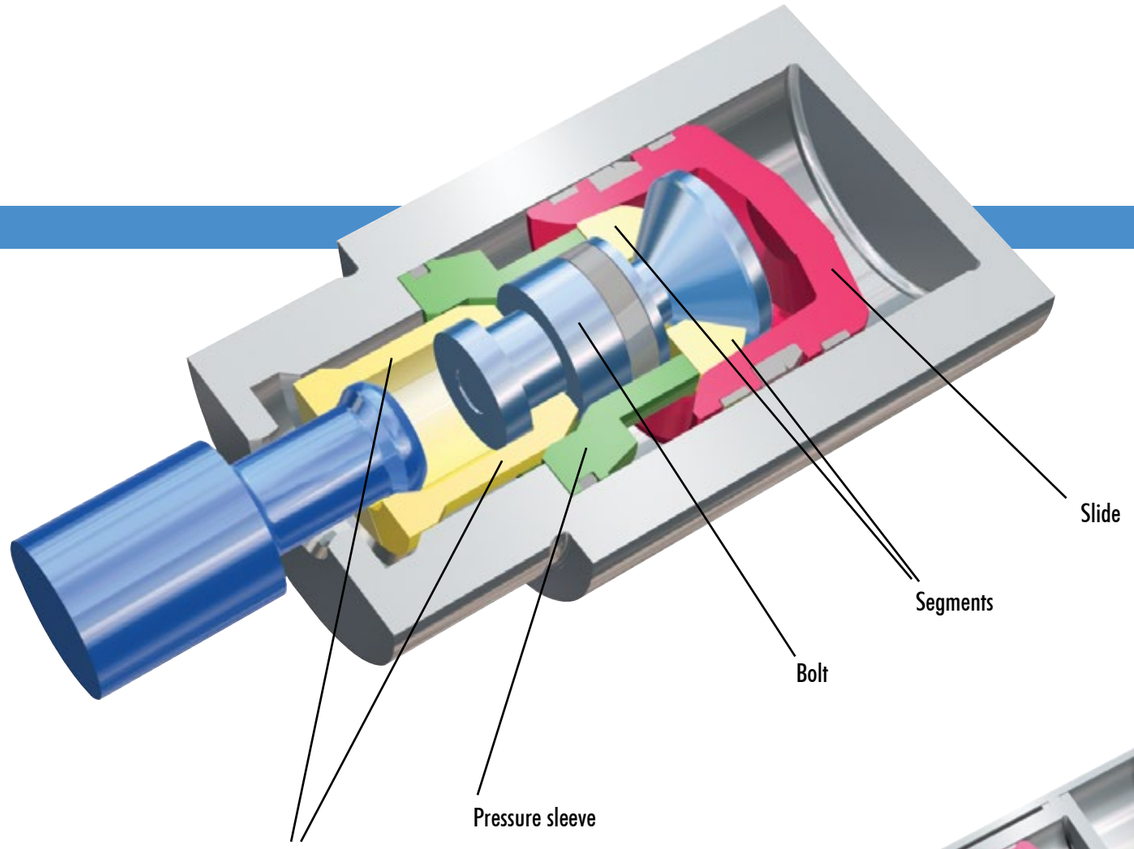
The previously described advantages of the **CyDim** are excellently enhanced by the actions of a positively locked collet coupling making it possible to realise the total functions

Couple - clamp - lock

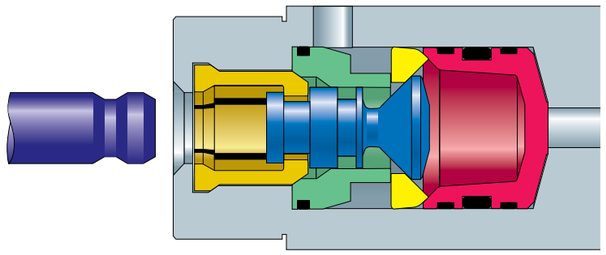
with only one element without any need of additional control requirements.

The jaws self open automatically by means of the rubber elements that are vulcanized between them. The closing motion occurs by means of a double connecting link that allows the jaws to close in parallel. This prevents early wear and fatigue of the clamping unit.

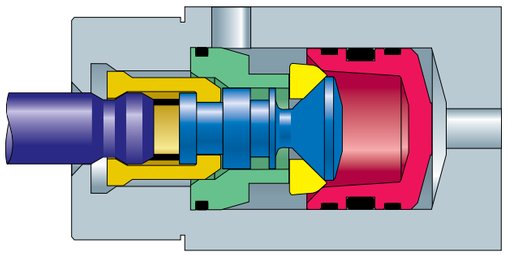
Self locking remains intact without maintaining pressure even under the influence of vibration.



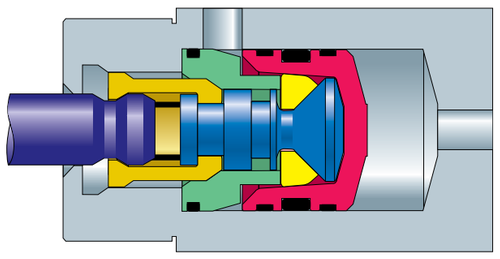
Function



The CyTrac is open and relaxed when the tool bolt is introduced.



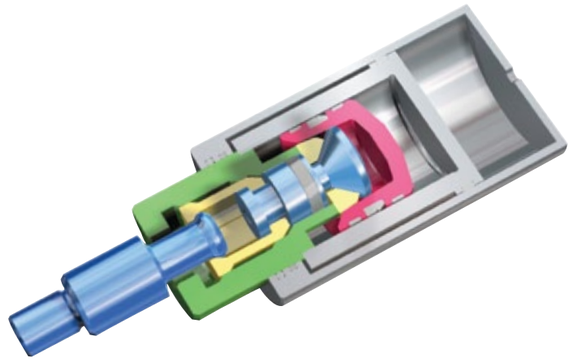
As the bolt is introduced the clamping jaws grip the rear groove of the bolt and draws it into the housing. During this phase the ratio between the feed and the pulling motion is 1:1. Pressure is introduced through the right hand port.



Here the system is locked with the bolt positively held by the clamping jaws under pre-load. The lock is released by putting pressure to the port at the top of the housing which allows the clamping jaws to return to their starting position.

In the past complicated constructions were rquired to move a passive coupling generally by using two additional cylinders. This task is easily achieved by a **CyTrac** unit -"the automatic srew".

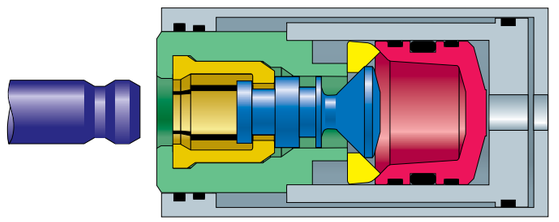
Further options include locking sensors, viton seals for high temperature applications and the use of silicone for vulcanization.



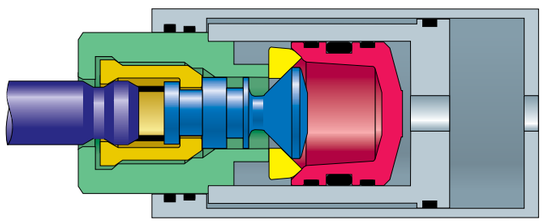
CyTrac "Scope"

The **CyTrac-Scope** is a variation to the basic **CyTrac** design whereby the housing of the **CyTrac** itself carries out an additional axial lifting motion, therefore, considerably expanding the clamping stroke. This occurs automatically during the clamping process.

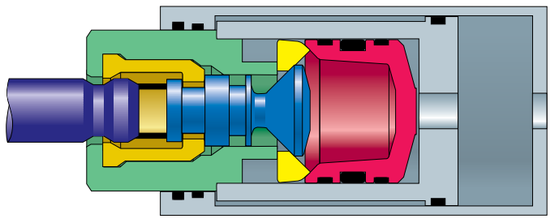
The coupling bolt is released simultaneously with the lock release. There is no need for additional control elements like valves etc. despite the enhanced function of the unit. The **CyTrac Scope**, as does the basic **CyTrac** unit, requires only two pressure connections.



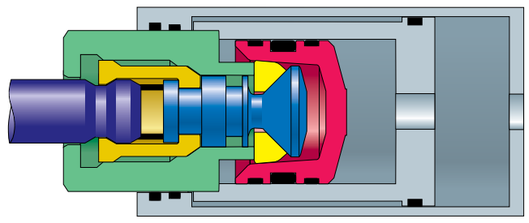
Phase 1



Phase 3



Phase 2



Phase 4

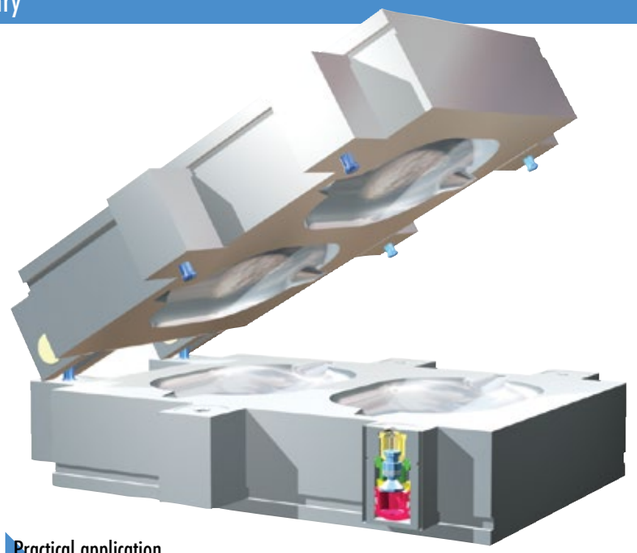
CyTrac

Innovative clamping technology for the plastic moulding industry

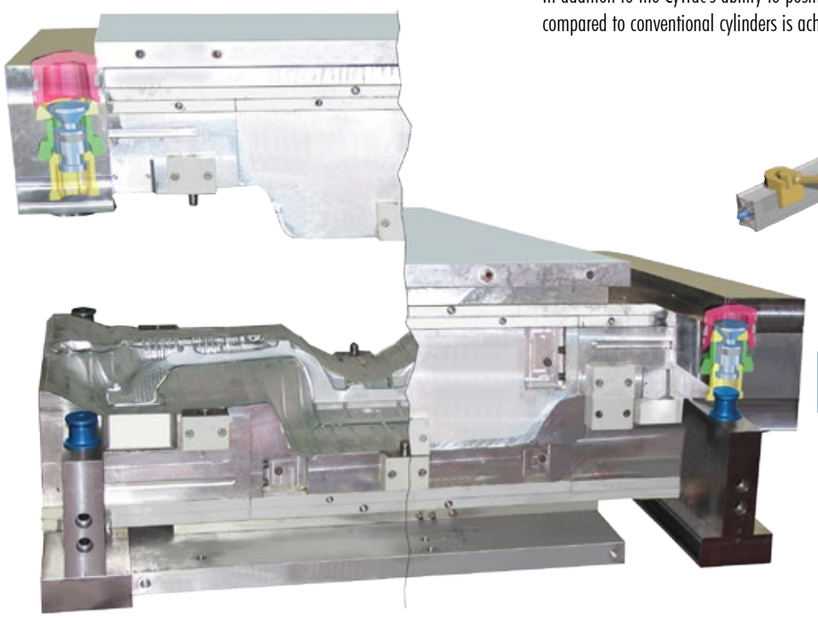
Typical applications

- Quick release tapers or hollow shaft retainers
- Tool clamping systems
- Workpiece straps
- Closing and locking of foaming tools
- Coupling of milling heads
- Clamping of milling heads in serrations
- Coupling milling machine tables
- Coupling extruder heads
- Locking of container lids
- Locking of multi couplings

CyTrac is a universally applied connecting element that fulfils most of the demands made by flexible production systems. It is suitable for use where easy but precise coupling of component assemblies is required within an automatic production process.
Typical applications for the **automatic screw** are to be found in the plastic manufacturing or machine tool building industries.



Practical application
Closing systems for foaming and blow forming machines
Clamping the two halves of the frame in foaming and blowform tools plays an important role in product quality. Because of this, oversize support frames are often used to absorb the pressure in the tool.
CyTrac units make things much easier. They allow the force to be transferred directly via the clamping plates so that the closing frame is only responsible for the motion. The pre-loaded locking mechanism allows the active pulling together of both parts with subsequent self locking. A symmetrical bolt is mounted on the fixed half and a **CyTrac Scope** with fluid couplings on the moving half.
In addition to the CyTrac´s ability to positively lock, a significant increase in force compared to conventional cylinders is achieved.



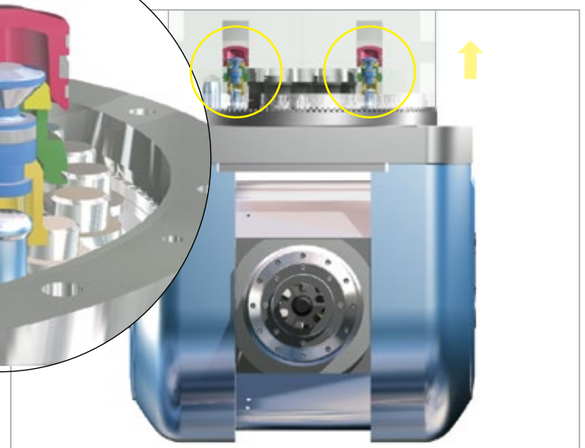
Practical application
Mould locking on blow forming machines
To reduce downtimes to a minimum the use of the "automatic screw" is recommended which guarantees a fast and safe locking of both mould halves even with high counter pressure.

CyTrac

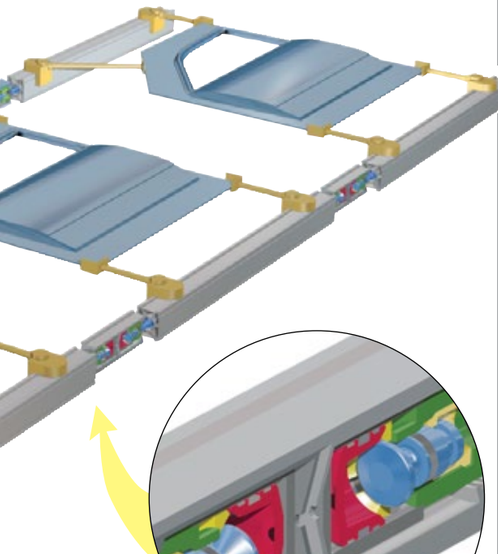
Innovative clamping technology for the machine tool industry

Practical application
Automatic changing of milling heads
An optimal machine utilization is released with the option of automatic head or spindle exchange. CyTrac enables safe docking and locking of head or spindle. The system can be integrated in the ram or the spindle housing and grabs and locks the corresponding clamping bolt. So head and spindle can be adapted to the appropriate milling demand of the workpiece simply and precisely.

Milling head released



Milling head clamped



Practical application:
Coupling of walking beams
in transfer systems on single presses of press lines.

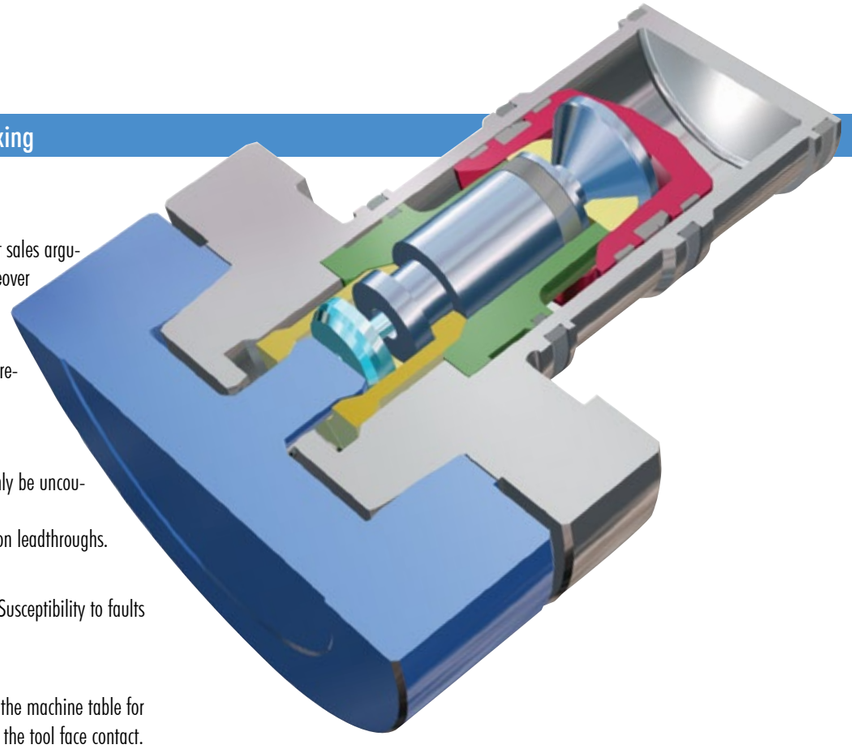
CyTab

Clamping system with collet chuck and indexing



Short set-up times and high flexibility are the most important sales arguments in the machine tool sector. Reducing workpiece changeover times plays a central role.

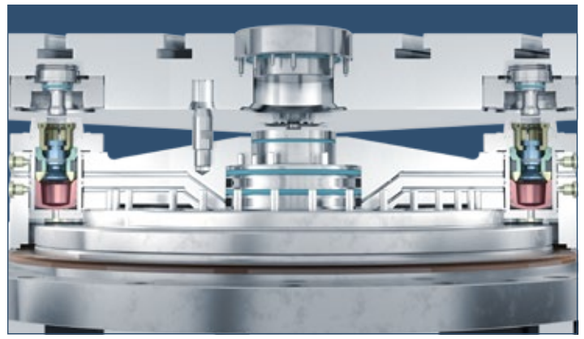
The **CyTab** pallet clamping system is derived from the collet clamp lock CyTrac with all its advantages and meets all requirements laid down by machine tool designers:

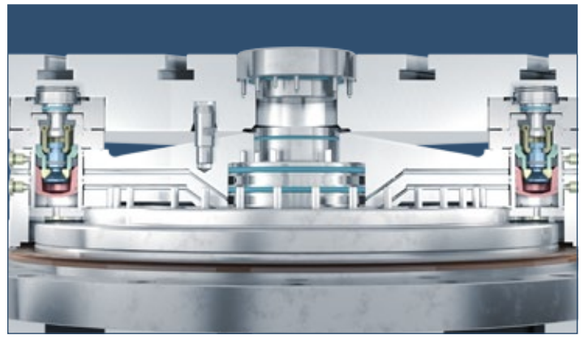
Self-locking:
In its clamped position the **CyTab** is self-locked, i.e. it can only be uncoupled with
energy. This makes it unnecessary to install rotary transmission leadthroughs.

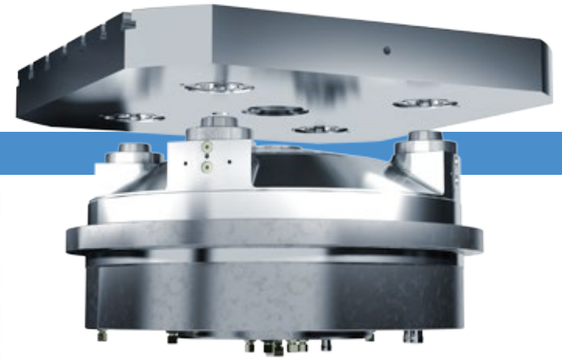
Integrated indexing:
The **CyTab** links indexing and clamping in a single element. Susceptibility to faults is considerably reduced.

External clamp monitors:
As an option, an external control system can be used outside the machine table for the query “pallet clamped or unclamped” and for monitoring the tool face contact.

Indexing - coupling - clamping - locking, **CyTab** does all this in a single pass. It integrates all the advantages of the CyTrac system.







Highest interchange accuracy

A clever arrangement of 4 **CyTab** clamps guarantees 100% fixing and positioning of standard pallets in the machining centres. Round fixed-point centring and angle indexing ensure highest interchange accuracy which is not even affected to any great extent by temperature effects.

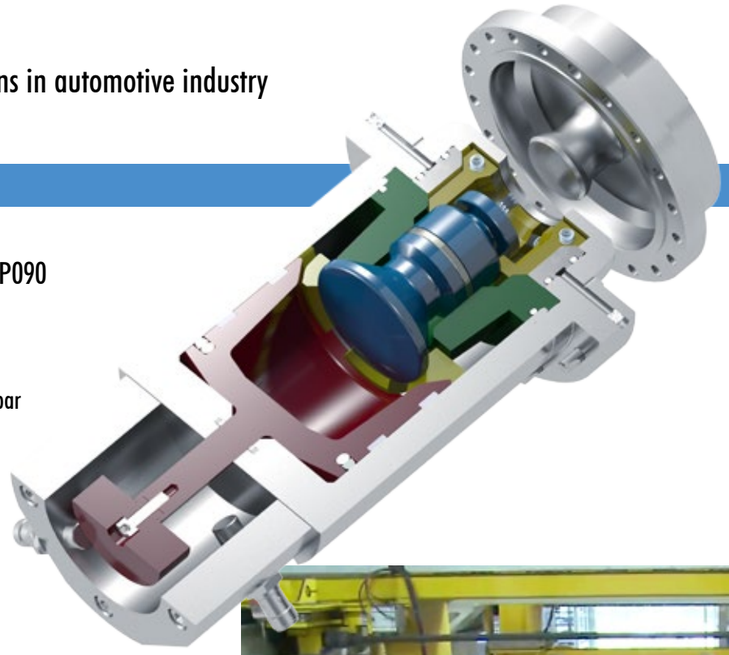
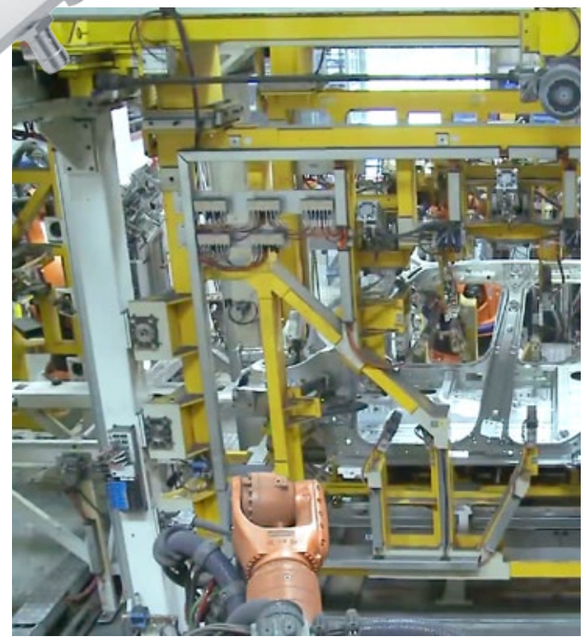
Applications in automotive industry

CyTab for bodyframing

Hydromechanical clamping system STP090

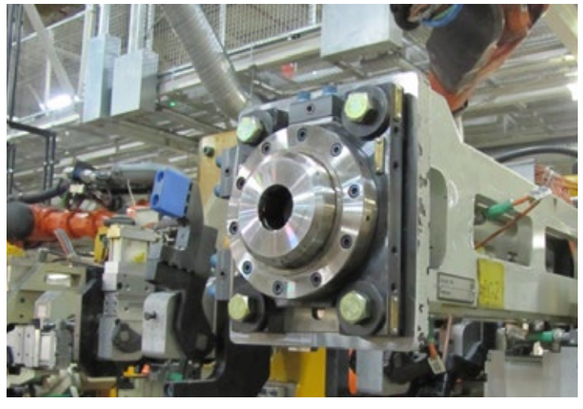
- 100% failsafe
- High clamping force: 12 kN
- Pneumatically operated; pressure: 6-12 bar
- Positively locked in clamped position
- Holding force: 40 kN
- Clamping stroke: 9 mm
- Repeatability: 0,001 mm



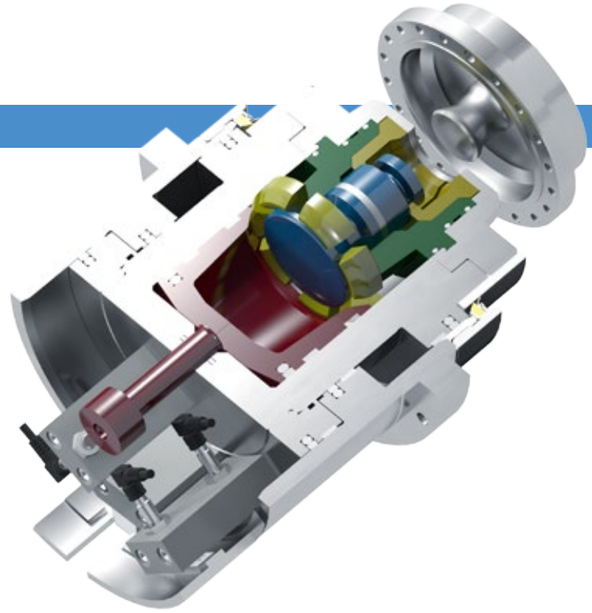


The pneumatic execution of the clamping system CyTab plays a central role in the automotive industry in automatic welding and assembly lines. Considerable vehicle manufacturers use these systems for years with great success to support and guarantee reliable, flexible and cost saving production.

Typical application area ist the bodyframing:
The geometry box with pre-built car body is the basic element, to which the different mounting frames with the lateral car parts are docked precisely and failsafe.
The actual clamping systems (four or six per frame) are attached to the outside corners of the box grasping and locking the mounting frames on each side. In only one functional process the flanges are centered, drawn in and positively locked. This guarantees a stable and reproducible operational process with very low maintenance effort.



CyTab "Scope" for vertical frame docking



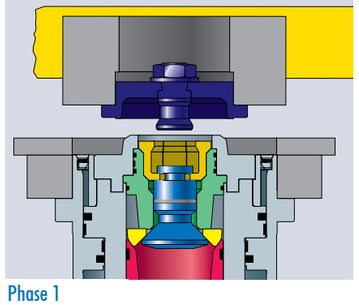
Hydromechanical clamping system STP090 "Scope" with additional grasping stroke

Function of the clamping system "Scope" version

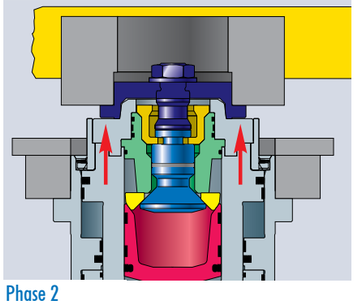
Basically the clamping process is the same as the standard CyTab or CyTrac systems.
Prior to that, the "scope" housing executes an additional stroke to grasp the external flange/draw bolt over a certain distance.

In short:

- The Scope housing extends and grasps the external draw bolt, that is in feed position (1).
- The actual clamping process follows by pressurising the clamping chamber (2).
- In final position, the flange is locked positively (3).



Phase 1



Phase 2

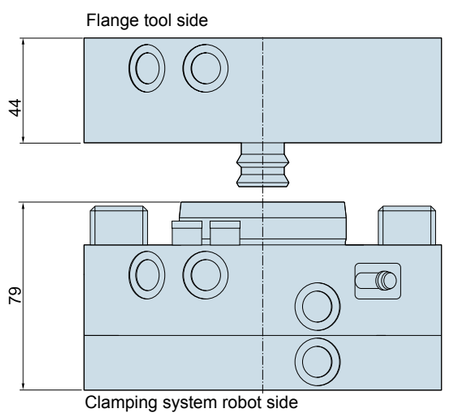
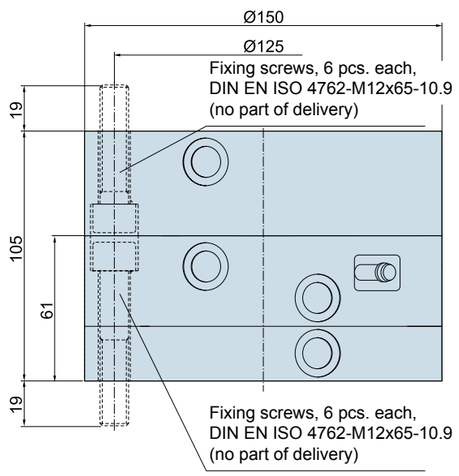
Max. admissible clamping pressure:	10 bar
Max. admissible release pressure:	12,5 bar





CyFit

Quick-action couplers

Locking and coupling

Because the **CyTab** is self-locking in the locked position, the energy can be decoupled. This means that it is not necessary to install rotary transmission leadthroughs or other expensive constructions. A reliable and precise system for energy coupling and decoupling with the lowest possible losses through leaks is the **CyFit** quick-action coupling system. This has a very compact construction and at the same time it guarantees extremely low flow-resistance with high through-flow speeds.
Thanks to the integrated offset and angle compensation system it is possible to compensate for production tolerances and inaccuracies during joining (see opposite). This usually means no need for additional tool holder screw threads, precentring devices and guides.

In addition, a special packing arrangement enables practically leakproof coupling and separating. Trapped air and impurities are avoided.

CyTab and **CyFit** represent the ideal combination of clamping and coupling systems. They guarantee trouble-free highly efficient working on modern machining centres with the shortest possible set-up times.

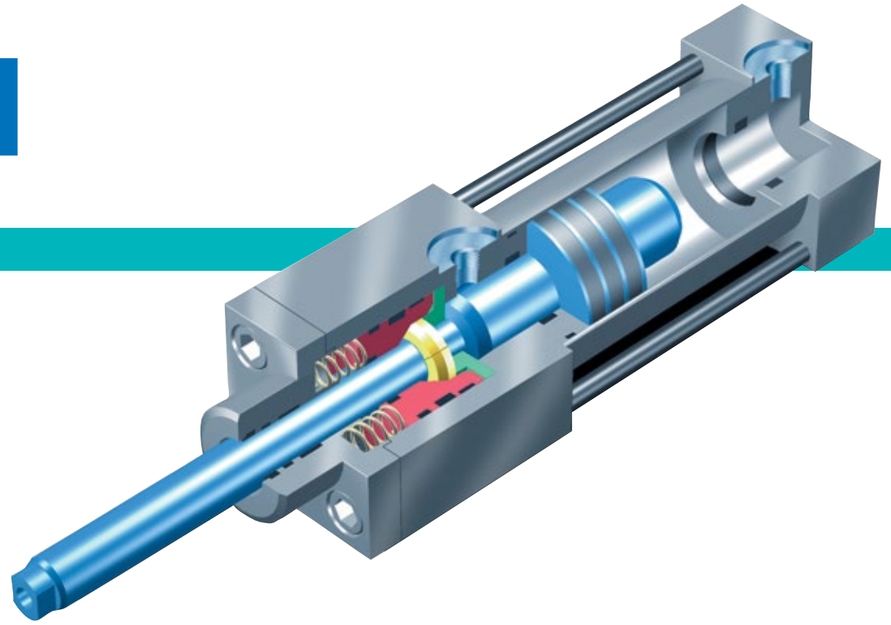
CyLock

Locking cylinder



CyTec is specialise in the development of special cylinders which reduce the technical expenditure on the construction.

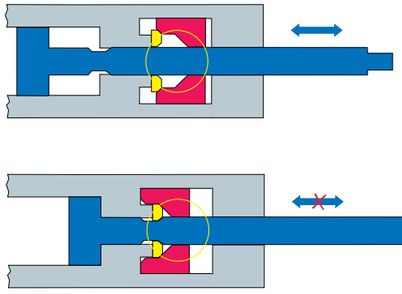
The cylinders are based on two basic design principles:

1. A cylinder that positively locks in its final position
2. A cylinder that offers friction locking at variable positions

The CyTec products are of multifunctional significance, that means:

- Effective in the field of lifting and material handling. Cylinders remain positively locked or friction locked even when power is disconnected.
- The high forces and the integrated safety function and simplify costly work intensive constructions.
- A reduction of components decrea ses the costs and increases the reliability.

Positive locking

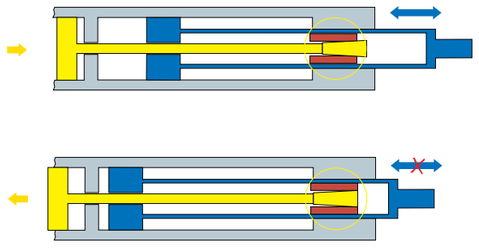


Typical features

- integrated locking device
- maximal operation security
- holding force up to several hundred tons
- no additional control
- exact locking point
- very simple installation
- compact design

The CyLock locking cylinder holds movable loads in one or both of the final positions and **locks positively**.

Frictional connection



Typical features

- high holding forces
- compact design
- self-locking when energy supp ly is interrupted
- locking in any intermediate position
- short reaction times

The CyStop braking cylinder brakes movable loads in every desired position with **frictional connection.**

CyLock

Locking cylinder

In some applications, particularly where a long lifting distance is needed, the use of **CyLock** cylinders with positive locking may be advantageous. These cylinders lock automatically without any additional controls in one or both of the end positions. Once the cylinder reaches the end stop position, the locking segments move into an annular groove in the piston rod (refer to **CyDim** system) and are positively locked by a locking slide (pre-load option).

In this position the system is self-restricting.

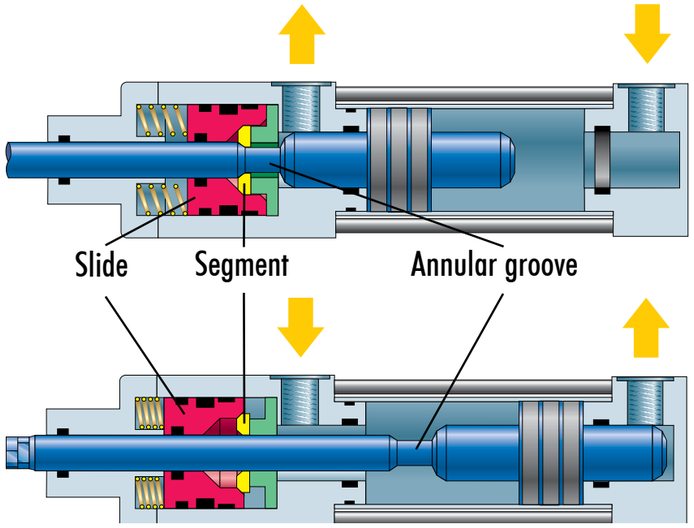
The guaranteed anti-crash feature and load rigidity for multiple counterforces are the most important features of the **CyLock** cylinder.

As the holding force is much higher than the lifting force, smaller structural sizes can be used than with conventional double acting cylinders.

For more information please request our CyLock brochure.

Application examples

- Safety cylinders on presses
- Pressure pads for punches
- Locking cylinder on containers and lids
- Locking cylinder on containers with elastic and non-elastic seals
- Clamping equipment for structural parts
- safe holding of components even in case of pressure drop



Locking (on an example of Cylinder type 01):

By applying pressure to the piston side the piston rod reaches its final position and becomes positively locked by the segments which are pressed into the annular groove.

Unlocking:

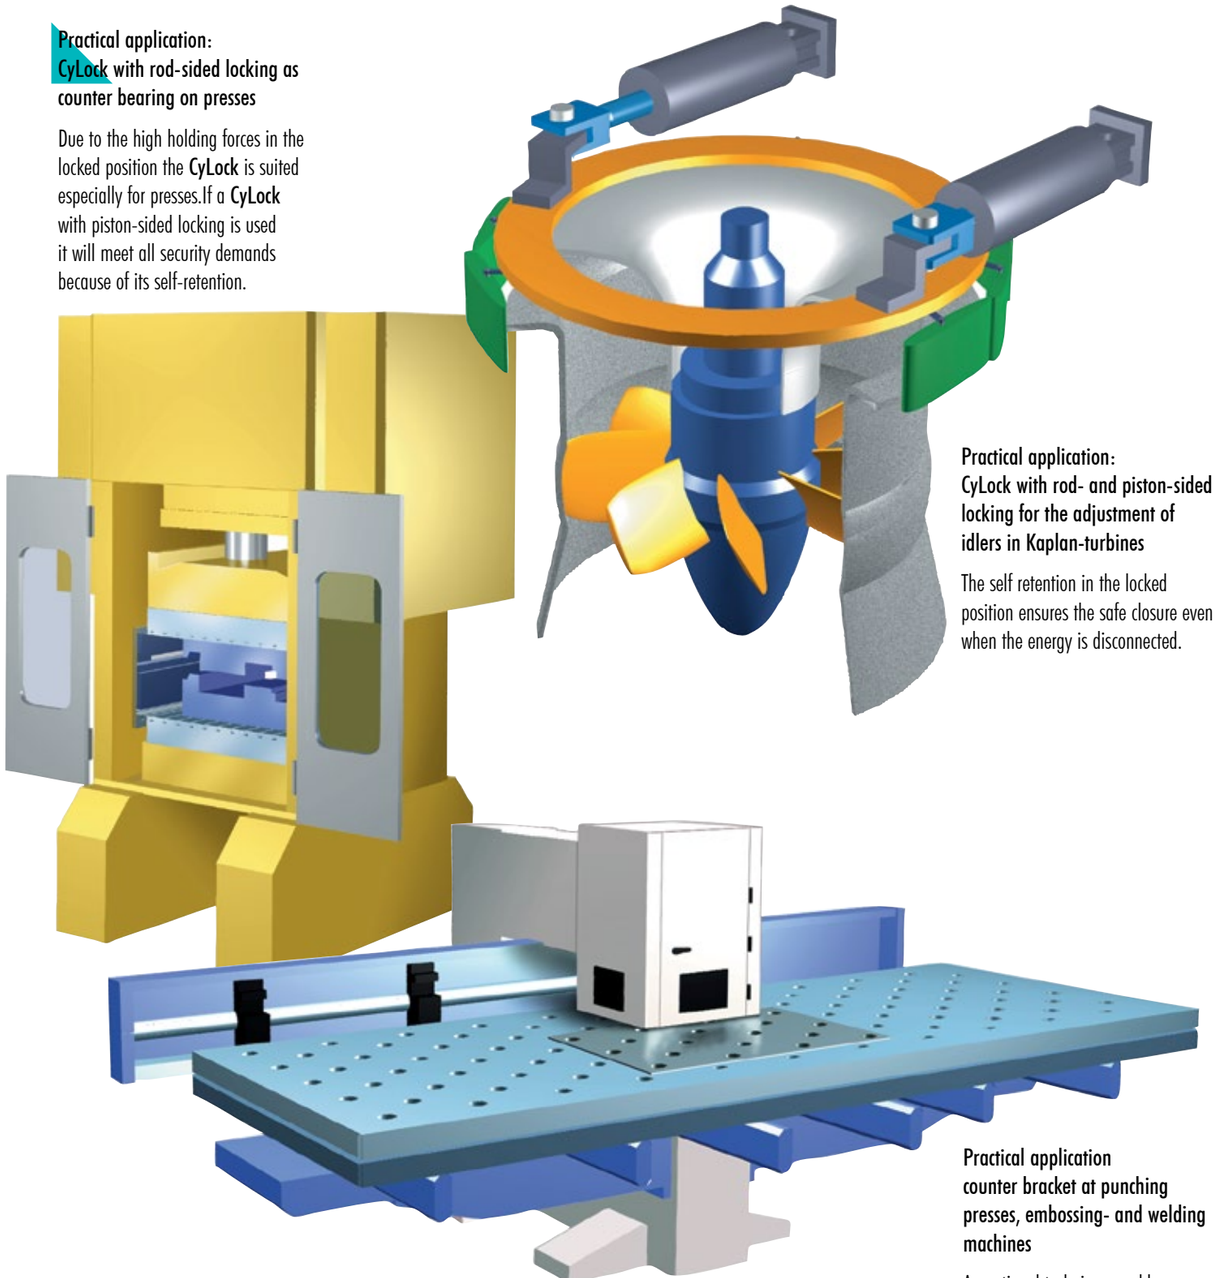
The reverse travel pressure releases the piston rod and it can return to the initial position.

Overview Cylinder Series						
	hydraulic locking cylinders		pneumatic locking cylinders			pneumatic braking cylinder
Series	HA	HB	PV	PT	PH	KP
Design	screw construction		tie rod version with square cross section			tie rod version with round cross section
Piston ∅	25 - 250 mm		40 - 250 mm	50 - 200 mm	40 - 250 mm	40 - 300 mm
Stroke length	free choice					
Holding forces	up to 440 kN	up to 880 kN	up to 320 kN	up to 140 kN	up to 140 kN	up to 60 kN
Stroke forces	up to 245 kN		up to 31 kN			up to 68 kN

CyLock

Practical application: CyLock with rod-sided locking as counter bearing on presses

Due to the high holding forces in the locked position the **CyLock** is suited especially for presses.If a **CyLock** with piston-sided locking is used it will meet all security demands because of its self-retention.



Practical application: CyLock with rod- and piston-sided locking for the adjustment of idlers in Kaplan-turbines

The self retention in the locked position ensures the safe closure even when the energy is disconnected.

Practical application counter bracket at punching presses, embossing- and welding machines

An optional technique enables a force enhancing during the process of punching, pressing, embossing and welding. This superelevated force is definite determinable and follows the ideal nominal line.

CyLock	Cylinder with integrated locking device
CyPull	Locking core-pull cylinder
CyDock	Docking system with self-locking
CyDim	Hydromechanical clamping system
CyTrac	Collet clamp lock
CyStop	Pneumatic cylinder with internal braking device
CyLift	Multifunctional lifting column
CyTab	Pallet clamping system

CyTwist	Spindle-clamping system
CySpeed	Motor spindle
CyTool	Manual tool clamping system
CyFit	Quick coupler
CyCon	Tool/spindle controlling system
CyCool	Tool cooling/lubricating system
CyMill	2-Achs-NC-Milling heads
CyTorque	Torque motors
